CDMA Voucher Uploading /Distribution/Sales Handling

RUIM Uploading /Distribution/Sales Handling

CDMA Voucher are FLPP, Sancharnet, CallNow , ITC are clubbed under Fixedline products menu
CDMA Prepaid RUIM is provided under separate heading.

CDMA Voucher handling is exactly same as Recharge Voucher of GSM Products except that separate category CDMA Products is created.

Inventory Loading

For CDMA RUIM a facility to upload RUIM out put file under MSC login is provided, this exactly similar to Prepaid SIM out file loading menu, however keeping the feedback and experience in SIM output file loading, small changes are incorporated in the system. Out file can be loaded against particular unit to whom RUIIMS are sent. That means ser can select SSA or Circle Stores to upload the inventory. The data is directly populated to user selected by MSC.

Distribution and Sales

The inventory can be allotted/Sold using existing allotment and Sales pages at Circle and SSA , CSC level. There will not be any change in the flow. However we may have to add additional users if stores for CDMA are managed by different users.

Exception :

Due the fact that these products are going to be dealt with same users in circle and SSA is not known, if any Circle desires to have separate user for CDMA products, a user needs to be created as Circle Accounts user with separate CSCCODE (ABCACCT, XYZACCT). This user will have all the facilities available to acct Role at Circle and can move the inventory to any of the field units.

Similar situation may exist in SSA, in that event another user can be added at SSA level with ACCOUNT-SSA role with CSC CodeACCTS and any user name. Name of the unit can be suitable decided to keep clarity.

However no further changes are anticipated, user addition may be done at back end based on Circle decision using scripts for each circle.(This is one time activity)

Sales to Franchisee /DSA /PCO

Existing Sales pages support the Sales of CDMA products with out any changes (Required Changes incorporated in the test server but no change for the user interface)

Sales to End Customers and Customer CAF Data entry

Pages similar to prepaid Sales are incorporated , which facilitate sale of MDN and present existing MDN /RUIM ID for updating.

CAF data is stored in CDMA_PrepaidCustomer table which can be sent to staging server , as is done for the GSM customer data .

Reports

Existing reports are adequate for system users, Key indicators may have to be deployed for CDMA product separately.

Specification or Requirements may be provided

For Sri Kul DS , Sr SA

for testing
